Codex Cloud Continuation Prompt

Codex Cloud Continuation Prompt

Use this prompt in Codex Cloud from the GitHub repository [dxmar24/AWD-30716-Quantum-Code](#) if another follow-up pass is needed.

You are continuing an academic-professional Advanced Web Development project named "American Latin Class Attendance System".

Repository state:

- Required academic folders exist: 01Definition, 02Requirements, 03Documentation, 04UMLDiagrams, 05UnitTests, 06Code, 07Other.
- Backend framework is Node.js + Express.
- Frontend framework is React + Vite under 06Code/frontend.
- ORM is Prisma with PostgreSQL:
 - 06Code/prisma/schema.prisma
 - 06Code/src/repositories/PrismaRepository.js
 - 06Code/src/repositories/PrismaDatabaseContext.js
 - DB_DRIVER=prisma in .env.example
- In-memory repositories remain for automated tests.
- Legacy raw pg repositories remain only as fallback with DB_DRIVER=pg; Prisma is the required production path.
- React private dashboard routing has been corrected so /private/dashboard.html returns the React app, not legacy public/private files.
- Ordered SQL migrations `001`-`012` are the deployment source of truth; Prisma maps the application model while PostgreSQL-specific checks/indexes and `schema\_migrations` remain SQL-owned.

Current validation commands:

- npm run db:generate
- npm run frontend:build
- npm test
- npm run db:migrate:status

- npm run db:smoke:prisma
- npm run db:smoke:operational
- cd python-analytics-api && python -m pytest -q

Possible future hardening:

1. Run Prisma against a live PostgreSQL database:
 - Set DATABASE_URL.
 - Run npm run db:migrate:status and npm run db:migrate.
 - Run both Prisma smoke commands. Never use schema push for deployment.
2. Add a PostgreSQL-backed integration test job if the environment provides a test database.
3. Improve React UX with real Google Sign-In client integration.
4. Split React components into separate files if the course reviewer values frontend organization.
5. Keep AWS documentation EC2/RDS oriented. Do not use Render or Netlify.

Constraints:

- Do not commit node_modules or dist build output.
- Keep English names in code.
- Keep API prefix /api/v1.
- Keep controllers free of business logic.
- Do not remove academic documentation folders.
