Final Compliance Review

Status

The project now satisfies the Advanced Web Development review path for a serious academic-professional submission.

Completed evidence

- Required academic folders remain present: `01Definition`, `02Requirements`, `03Documentation`, `04UMLDiagrams`, `05UnitTests`, `06Code`, and `07Other`.
- Backend remains Node.js + Express with `/api/v1` routes and controller/service/repository layering.
- ORM production path is Prisma with `DB_DRIVER=prisma`, `06Code/prisma/schema.prisma`, `PrismaDatabaseContext`, and `PrismaRepository`.
- React + Vite frontend exists under `06Code/frontend` and builds to `06Code/dist/frontend`.
- Express serves the built React frontend, including `/private/dashboard.html`, through the React app instead of the removed legacy private dashboard files.
- SQL and Prisma schemas are aligned for level promotion evaluation auditing (`evaluated_by` and `evaluated_at`).
- Prisma smoke validation is available with `npm run db:smoke:prisma` when `DATABASE_URL` points to PostgreSQL.

- AWS documentation remains EC2/RDS oriented and does not rely on Render or Netlify.

Remaining operational notes

- A live PostgreSQL database is required to run `npm run db:push`, `npm run db:migrate`, and the Prisma smoke script against real infrastructure.
- Raw `pg` repository support remains documented as fallback only; Prisma is the required production path.
