Testing Guide

Run tests from `06Code` :

```
npm install
npm test
```

Run the API validation report:

```
npm run test:api:validation
```

Run the Postman/Newman JWT evidence:

```
npm run postman:evidence:local
```

Current automated coverage:

- Auth/session: Google login, Postman email/password login, seeded password-hash role login, logout, invalid Google token, expired session, private page redirect/no-store and valid private dashboard access.
- JWT/Postman session: `/auth/login` returns `sessionToken`, Bearer token can call `/auth/me`, logout revokes the backend session, and the same token returns `401`.
- RBAC: invalid role cannot access consolidated reports.
- Rules: scholarship threshold, promotion candidate rule, teacher payment calculation.
- Academic integration: enrollment request, duplicate attendance rejection, absence review, scholarship evaluation, level promotion evaluation.

Expected result:

```
Test Suites: 4 passed, 4 total
Tests:      20 passed, 20 total
```

Current API validation result:

```
API validation completed: 108/108 passed.
```

Current Postman/Newman evidence:

```
Requests: 67 executed, 0 failed
Assertions: 78 executed, 0 failed
```

Evidence files:

- 03Documentation/api-validation-report.md
- 070ther/api-validation-results.json
- postman/evidence/postman-local-jwt-auth-evidence.md
- postman/evidence/postman-local-jwt-auth-evidence.json

If npm reports `UNABLE_TO_VERIFY_LEAF_SIGNATURE` in a local/corporate Windows environment, configure the local certificate chain or run the install in a trusted shell configuration. Do not disable TLS verification in production.
